

AMENDMENTS TO THE ABSTRACT

Please insert the following Abstract:

A SIM card for operation with a terminal device of a mobile telecommunication network is configured in such a manner that with the terminal device only connections to fixed destination or source addresses, or both, can be established. The destination and source addresses permissible in connection with the SIM card are stored in a memory of the SIM card or in a database of the mobile telecommunication network. Use of the network by the terminal device is limited by using the SIM card in the terminal device to permit connections only to fixed destination and/or source addresses. The destination and source addresses are phone numbers, URLs or APN's (Access Point Names). The SIM card only supports defined telecommunication services. The SIM card encompasses more than one different subscriber relationship, wherein the use of the SIM card is assigned according to the originator principle to the respective subscriber relationship.
